1. Abstract
The ability to change behavior is a universal property of animals, which is reflected in the neural circuitry of the Drosophila brain. The ability to change behavior is also reflected in the neural circuitry of the human brain. The ability to change behavior is also reflected in the neural circuitry of the human brain.

2. Mutant optomotor behavior

3. Radish behaves randomly in the maze

4. Radish is hyperactive

5. Reduced fixation time in radish

6. An attention deficit in radish

7. Attention-like bias switches randomly in radish mutant flies

8. Ritalin rescues radish
